

DISTRIBUTION OF *CLITORIA* (LEGUMINOSAE: PHASEOLEAE: CLITORIINAE) IN THE FLORA MESOAMERICANA AREA

PAUL R. FANTZ¹

Abstract. Documentation data of herbarium specimens examined and distribution of the taxa is presented for the manuscript on *Clitoria* (Leguminosae) submitted for the *Flora Mesoamericana*.

Keywords: *Clitoria*, Fabaceae, *Flora Mesoamericana*, Central America, identification key, exsiccatae

The treatment of *Clitoria* L. (Fabaceae) for the *Flora Mesoamericana* was first submitted in 1995 with an updated revision in 2003 (Fantz, ined.). Data from herbarium vouchers examined and distribution records of the taxa are extremely limited in the manuscript as editorial guidelines limited the citation of specimens to one per country or state in México. Although the *Flora Mesoamerica* (FM) website (www.mobot.org/MOBOT/fm/) has an exsiccatae data base section, current data is sparse, and appears to include primarily collections deposited at MO. The length of time between treatment submission and flora publication has reached a decade, and it is uncertain when the data will be released in print. Data entry of exsiccatae will be time consuming, and it is uncertain when data will be available online or how extensive the exsiccatae will be. Also, it is uncertain whether exsiccatae data will include those collections examined by authors of taxonomic treatments, or additional collections that were not included in their original

study. Botanists working on Central American research projects, who wish to review distributional data in the exsiccatae, will find the FM database cumbersome as well as incomplete. It requires several button clicks to view data on a single specimen. One is unable to search by locality for an overview of specimens of a taxon collected in that area. In addition, there is no indication that the FM exsiccatae is archived in hard copy.

The exsiccatae studied in the development of the treatment of *Clitoria* for the *Flora Mesoamericana* are published herein to assist researchers working on Central American research projects. Included are Central American specimens derived from over 10,200 worldwide collections of *Clitoria* examined and annotated by the author. A key to taxa of *Clitoria* is provided to assist botanists with identifications of their own collections of the genus or in examining collections not found in this list of exsiccatae.

METHODS

Herbarium vouchers of *Clitoria* from Mesoamerica [southern México (states of Campeche, Chiapas, Quintana Roo, Veracruz, Yucatan) to Panama] cited herein are specimens from 40 international herbaria. All vouchers cited have been identified and annotated by the author. Specimen data presented here includes country, province,

major site, collector(s) and number, and herbaria of deposit. Complete label information is maintained by the author. CIAT collections made from material grown in cultivation in Cali, Colombia are cited herein under the location where seed was collected in the wild. Author abbreviations follow Brummitt & Powell (1992).

The author thanks the curators of the cited herbaria for sending loans or allowing visits and two anonymous reviewers for thoughtful comments on a previous version of the manuscript.

OBSERVATIONS

Mesoamerica includes a taxonomically diverse group of species within the genus. Primitive subgenus *Bractearia* (Mart. ex Benth.) Fantz includes 30 species of trees, large shrubs and lianas and is predominately South American in distribution. Two species, *C. glaberrima* Pittier (sect. *Brachycalyx* Fantz) and *C. javitensis* (Kunth) Benth. (sect. *Cauliflorae* Fantz), have migrated northward into Panama with sparse distribution elsewhere in Mesoamerica. Subgenus *Clitoria* includes five Paleotropical species. One African species, *C. ternatea* L., has been introduced into the Neotropics through cultivation, but has escaped and currently is known from naturalized populations throughout Mesoamerica. The more advanced subgenus *Neurocarpum* (Desv.) Baker includes 24 species. Two species, *C. falcata* Lam. and *C. guianensis* (Aubl.) Benth. of South American sect. *Neurocarpum* have migrated into Mesoamerica northward to central México. Two species, *C. mexicana* Link and *C. polystachya* Benth., of sect. *Mexicana* Fantz have migrated from Mexico south through Mesoamerica.

Cleistogamy and chasmocleistogamy occurs in Mesoamerican species *C. falcata*, *C. guianensis*, *C. mexicana*, and *C. polystachya*. Cleistogamous flowers commonly are borne at lower nodes before the showy chasmogamous flowers appear. Cleistogamous flowers are inconspicuous, apetalous or with petal remnants within the calyx tube, and bear a minute calyx (tube 4–8 mm long, lobes 2–4 mm long) and bracteoles 3–7 mm long. Chasmocleistogamy does occur, but has been vouchered infrequently, with chasmogamous flowers borne cen-

trally in the plant and cleistogamous flowers borne at lower or apical nodes, or both. Herbarium collections with cleistogamous flowers often were unidentified to species or misidentified to genus prior to the author's study of *Clitoria*.

Fantz (1980, 1981) reported that *Clitoria arborescens* R.Br. (cited incorrectly as *C. arborescens* Ait.) was misapplied to a number of vouchers of *Clitoria javitensis* in Mesoamerica. *Clitoria arborescens* is distributed in northern South America, from French Guiana to eastern Venezuela, with isolated collections from Colombia and northern Venezuela. The name *Clitoria laurifolia* Poir. has been misapplied to specimens of *C. guianensis* and does not occur in Mesoamerica.

Several species have distinct varieties and forms. The rank of *forma* is not recognized by many botanists, but included herein as herbarium vouchers were annotated with form names. The forms represent distinct morphological variation that has led some botanists to assign new varietal or species names in the historical literature, or as annotations on herbarium sheets. For example, *Clitoria falcata* Lam. f. *heteromorpha* (Griseb.) Fantz has an imperfectly formed costa, extending only 1/3 to 2/3 the length of the fruit valve, and is a form found in the Caribbean Islands with one collection each in Guatemala, Honduras and Venezuela. Cauliflorous specimens of *C. javitensis* that lack leaves were cited under the typical infraspecific taxon and highlighted with an asterick (*) next to the herbarium acronym.

RESULTS

Taxa are listed alphabetically. Also, distribution data for taxa are presented alphabetically by country, then by province, then by collector(s). Collectors with multiple collections are cited in ascending order by their collection number. Collection dates generally are excluded, but are included when specimens lacked a collection number (*s.n.*, *sine numero*).

Provinces, states, or departments have been bold-faced to allow the reader to overview data quickly. Locality data has been abbreviated for

geographical features cited frequently on collection labels (Table 1). Standard map references (e.g., latitude and longitude) cited by modern collectors are included. Locality data and abbreviations used by collectors were cited as presented on the herbarium label. Elevation and habitat data, included in the floristic treatment, were excluded here. I am willing to share complete data with researchers who request it.

Standard acronyms are utilized for herbarium voucher citations following Holmgren et al.

TABLE 1. Abbreviations used in citing locality data for *Clitoria* herbarium vouchers.

(1990). An acronym followed by a number (e.g., F-3) indicates the number of sheets of a collection in their herbarium. Acronyms followed by a lowercase "m" (e.g., F-m) indicate that the specimen has mixed material of two or more species. Occasionally, duplicates of one collection number are a

mixture of more than one species, so that duplicates in different herbaria represent different species. Mixed collections are cited with the misidentified duplicate vouchers preceded by the word "non" (e.g., BM, F, non C, GH, MO).

KEY TO TAXA OF *CLITORIA*

1. Leaflets 5–7; inflorescence 1-flowered; bracteoles 5–8 mm wide; legume subsessile, stipe 1–2 mm 2. (*C. ternatea*)
1. Leaflets 3; inflorescence 2-several flowered; bracteoles 1–4 mm wide; legumes stipitate, stipe 4–33 mm 5.
2. Flowers papilionaceous; stamens diadelphous..... 3. (*C. ternatea* var. *ternatea*)
2. Flowers "double," petals 5, standard-like; stamens 10, free 4. (*C. ternatea* var. *pleniflora*)
3. Flowers white with vexillum greenish to greenish-white medially.....
..... *C. ternatea* var. *ternatea* f. *albiflora* (p. 50)
3. Flowers blue to purple with vexillum yellow to white medially ..*C. ternatea* var. *ternatea* f. *ternatea* (p. 50)
4. Flowers blue to purple*C. ternatea* var. *pleniflora* f. *pleniflora* (p. 50)
4. Flowers white..... *C. ternatea* var. *pleniflora* f. *leucopetala* (p. 50)
5. Calyx lobes 9–15 mm; bracteoles 7–14 mm long; fruit costate; staminal sheath 20–40 mm..... 6.
5. Calyx lobes 2–8 mm; bracteoles 3–8 mm long; fruit ecostate; staminal sheath 15–21 mm or 43–49 mm (in *C. javitensis*) 9.
6. Herbaceous vine, stems twining and climbing; leaves petiolate, petiole 2.5–4 cm; leaflets broad to 5 cm wide; peduncle to 15 cm; flowers 4–5 cm, white 7. (*C. falcata*)
6. Shrub, stems erect; leaves subsessile, petiole to 1 cm; leaflets narrow, to 2 cm wide; peduncle less 1 cm long; flowers 5.5–7 cm, bluish-lavender 8. (*C. guianensis*)

7. Legume with prominently raised costa extending the length of the valves; common.....*C. falcata* var. *falcata* f. *falcata* (p. 45)
7. Legume with medial costa extending one-third to two-thirds the length of the valves, or ecostate (often various types on one individual plant); infrequent.....*C. falcata* var. *falcata* f. *heteromorpha* (p. 46)
8. Legumes costate, costa prominently raised, extending nearly the entire length of the valve; common.....*C. guianensis* var. *guianensis* f. *guianensis* (p. 47)
8. Legumes ecostate, or with costa imperfectly formed, weakly raised, extending only one-quarter of the valve to rarely nearly the entire length of the valve (often mixture of costa lengths on one individual plant).....*C. guianensis* var. *guianensis* f. *imperfecta* (p. 47)
9. Flowers 6.5–8 cm, pinkish; calyx tube 17–24 mm long, lobes 4–6 mm long; staminal sheath 43–49 mm long; legume stipe 24–33 mm long; liana.....10. (*C. javitensis* var. *portobellensis*)
9. Flowers 2.5–4 cm long, white or with bluish-purple marginally on banner; calyx tube 7–12 mm long, lobes 2–4 or 5–8 mm long; staminal sheath 15–21 mm long; trees, shrubs or subshrubs.....12.
10. Leaf apex tapering, acuminate; common.....11.
10. Leaf apex truncate to more or less retuse; rare.....*C. javitensis* var. *portobellensis* f. *truncata* (p. 49)
11. Leaf pubescence on lower surface conspicuously pilose to glabrate with age, trichomes on veins spreading to suberect; infrequent.....*C. javitensis* var. *portobellensis* f. *pilosa* (p. 48)
11. Leaf pubescence on lower surface inconspicuously appressed to glabrate, trichomes on veins appressed, non-spreading; common.....*C. javitensis* var. *portobellensis* f. *portobellensis* (p. 48)
12. Tree; larger leaflets to 6–9 cm wide; legumes flat, 110–200 mm long, 16–20 mm wide, stipe 10–12 mm; flowers white with blue-purple marginally on banner; cleistogamy absent....*C. glaberrima* (p. 46)
12. Shrub or subshrub; larger leaflets to 3–6.5 cm wide; legumes turgid, 25–50 mm long, 6–8 mm wide, stipe 4–8 mm; flowers white; cleistogamy present.....13.
13. Flowers 3–4 mm long; calyx lobes 5–8 mm long; inflorescence pseudoracemose; legume dehiscent valves twisting 1–1 ½ turns; subshrub, training to weakly climbing apically.....*C. mexicana* (p. 49)
13. Flowers 2.5–3 cm long; calyx lobes 2–4 mm long; inflorescence paniculate; legume dehiscent valves twisting less than one turn; shrub to 5 m.....*C. polystachya* var. *polystachya* (p. 49)
